FoxOtale

STAFF APP

Stay Original, Live the Tale

Design System

v1

The single source of truth for colour, type, spacing, components and data visualisation across the FoxOtale Staff App — the role-based operations product used by owners, area heads, managers, supervisors and frontline executives to set up a property, run it daily, and read its numbers.

DOCUMENT	**Design System — v1**

What is in here

This system is written to be implemented, not admired. Every colour carries a measured contrast ratio, every type size a purpose, every component a rule for when not to use it. Where a decision was made on the product's behalf rather than taken from the brand sheet or the PRD, it is marked.

01	**Principles**	Five rules that settle most arguments
02	**Colour — brand**	The given palette, and why chrome needed a derived step
03	**Colour — neutrals & semantics**	The greys that carry the data; state colours
04	**Colour — dark mode**	Night shift and night audit are real
05	**Accessibility**	The contrast matrix, verified
06	**Typography**	Inter for work, Lora for the brand moment
07	**Numerals & currency**	₹, Indian digit grouping, tabular figures
08	**Space, shape & elevation**	4pt base, restraint with shadow
09	**Iconography & status language**	One vocabulary for room, payment and task state
10	**Components**	The set the 25 PRD screens actually need
11	**Roles & permission states**	Seven roles, hidden not disabled
12	**Data visualisation**	Validated palettes and chart rules
13	**Motion**	Short, purposeful, interruptible
14	**Do & don't**	The failure modes worth naming
15	**Token reference**	Dart naming for lib/theme/
16	**Open items**	What this version does not yet settle

01

Principles

The PRD describes the Staff App as “a calmer, denser, high-clarity tool — built for daily operational and management use, not for delight,” in deliberate contrast to the guest-facing product. These five rules translate that sentence into decisions a designer or engineer can apply without asking.

01 Orange means act or attend to.

The brand orange is the loudest thing on any screen, so it is spent only on what the user should do next or notice now: primary actions, the active navigation item, the figure that is off-plan. Room status, payment status and task status use the semantic palette instead. If a pending-payment total and a New booking button are both orange, neither wins.

02 The number is the interface.

Occupancy, ARR, room nights, revenue and variance are why managers open this app. Figures get the largest type on the screen, tabular numerals, and no decoration competing beside them. Labels are small and quiet; the value is loud.

03 Hide what a role cannot do.

PRD P0-1 requires unauthorised actions to be hidden, not disabled. A disabled control advertises a capability and teaches nothing. A Supervisor should not learn the shape of the Owner's dashboard by seeing it greyed out.

04 Colour is never the only signal.

Frontline staff work in varied light, on cracked screens, sometimes with colour-vision deficiency. Every status carries a label and an icon or shape alongside its colour. This holds for room boards, payment states, task queues and charts alike.

05 Built for a shift, not a demo.

Touch targets stay at 48pt because housekeeping taps them with wet hands and in a hurry. Status changes survive a weak signal. Empty states say what is true — “No tasks in your queue” — rather than apologising.

02

Colour — brand

Two oranges and a cream arrive from the brand sheet. They are correct and they do not change. What they cannot do is carry text, and that gap is filled by one derived step rather than by quietly altering the brand.

Fox Flame
#FF4200
Logo O, HOTELS, primary fills
brand.flame

Fox Ember
#EA5F04
Logo mark, secondary fills
brand.ember

Fox Deep
#C74000
Chrome, orange text, links
brand.deep

Parchment
#FEF9E6
Warm surface, empty states
brand.parchment

Why a third orange exists

You chose orange application chrome — an orange app bar and bottom navigation, with neutral content between them. That decision has one hard consequence. White text on either brand orange falls below the WCAG AA threshold of 4.5:1, so an app bar title set in Fox Flame would be non-compliant on every screen of the product.

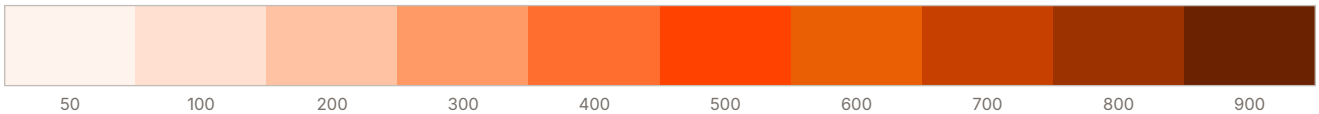

Background	White text on it	AA body text (4.5:1)	Verdict
#FF4200 Fox Flame	3.48:1	Fails	Fills, icons, large display only
#EA5F04 Fox Ember	3.42:1	Fails	Fills, charts, logo mark
#D24400 (boundary)	4.60:1	Passes, no margin	Rejected — too tight
#C74000 Fox Deep	5.05:1	Passes	Adopted for chrome and text

> **The rule**
> Fox Deep is the only orange permitted behind white text or used as text on a light surface. Fox Flame and Fox Ember remain the brand's face — the logo, the floating action button, chart series one, a filled selection — anywhere the colour is a shape rather than a letterform.

Orange scale

A full ramp exists so that tints and pressed states are drawn from the system rather than invented per screen. Steps 500 and 600 are the brand values, unmodified.

brand.orange.50 → 900

500 is Fox Flame. 600 is Fox Ember. 700 is Fox Deep. Steps 50–200 are surface tints for selected rows and hover states; 800–900 are pressed states and dark-mode text.

03

Colour — neutrals & semantics

The neutrals are warm, not grey. A pure grey beside Fox Flame reads as an accident; a neutral carrying a trace of the brand's warmth reads as chosen. Every value below is stated with its measured contrast against white, because in a product this dense the difference between a legal label colour and an illegal one is two steps on a ramp.

Token	Hex	On white	Use
neutral.900 Ink	#1A1613	17.98:1	Primary text, all figures
neutral.800	#3D3733	11.71:1	Secondary text, table values
neutral.700	#5C534D	7.50:1	Tertiary text, captions
neutral.600	#78706A	4.86:1	Lowest legal text colour
neutral.400	#9A928C	3.06:1	Disabled, placeholder — never body text
neutral.300	#C4BDB7	1.86:1	Borders, input outlines
neutral.200	#E3DEDA	1.34:1	Dividers, table rules
neutral.100	#F4F1EE	1.13:1	Surface, table header fill
neutral.000	#FFFFFF	—	Card and sheet ground

> **Neutral.600 is the floor**
> Any text below #78706A fails AA at body size. Placeholder text and disabled labels sit at neutral.400 by deliberate exception — they are not content, and the information they carry is always available elsewhere on the screen.

Semantic colours

Four states, each above 5:1 on white, each paired with an icon and a text label so the colour is reinforcement rather than the message. These are reserved: they never appear as a chart series or a decorative accent.

04

Colour — dark mode

Dark mode is specified, not deferred. The front desk runs night shifts, night audit happens at 2am, and a housekeeping supervisor checking a queue in a dim corridor should not be flashbanged. The dark palette is selected against a warm near-black ground rather than produced by inverting the light one — an inverted Fox Flame vibrates badly on dark and an inverted neutral ramp loses its warmth.

Token	Light	Dark	Note
surface.base	#FFFFFF	#14100D	Warm near-black, not #000
surface.raised	#F4F1EE	#1F1A16	Cards, sheets
surface.sunken	#FEF9E6	#0D0A08	Empty states, wells
text.primary	#1A1613	#F5EFE9	13.9:1 on dark base
text.secondary	#3D3733	#C6BDB5	8.6:1
text.tertiary	#5C534D	#A79E96	5.9:1
border	#C4BDB7	#3A322C	Hairlines
brand.action	#C74000	#FF7A45	Orange must lighten on dark
semantic.success	#1B7A44	#5BC98B	
semantic.warning	#9A6200	#E7A94A	
semantic.danger	#C0271F	#F2837B	
semantic.info	#1A5FA8	#7FB2F0	

Do not tint the app bar orange in dark mode
A saturated orange bar against a near-black interface is the single harshest thing the palette can produce, and it is looked at for eight hours. In dark mode the chrome becomes surface.raised with the brand carried by the active navigation item and the action colour alone.

05

Accessibility

Every pairing in this system was measured, not judged. The table below is the record; it is also the test. Any new colour added to the product must be entered here with its ratio before it ships.

TEXT ON BACKGROUNDS

Foreground	Background	Ratio	AA body	AA large
Ink #1A1613	White	17.98:1	Pass	Pass
Ink #1A1613	Parchment #FEF9E6	17.04:1	Pass	Pass
neutral.600 #78706A	White	4.86:1	Pass	Pass

Fox Deep #C74000	White	5.05:1	Pass	Pass
Fox Deep #C74000	Parchment #FEF9E6	4.78:1	Pass	Pass
Success #1B7A44	White	5.37:1	Pass	Pass
Warning #9A6200	White	5.10:1	Pass	Pass
Danger #C0271F	White	5.91:1	Pass	Pass
Info #1A5FA8	White	6.47:1	Pass	Pass

Beyond contrast

- Minimum touch target 48×48pt with at least 8pt between adjacent targets. This is set by housekeeping and front-desk use, not by the smallest control that fits.
- Every interactive element has a visible focus state: a 2pt Fox Deep ring at 2pt offset. External keyboards are used at the front desk.
- Body text scales to 200% without truncation or horizontal scrolling. Figures and table cells reflow; they do not clip.
- Status is never colour-alone. A room chip carries a label; a chart series carries a legend and, where four or fewer series, a direct label.
- Motion respects the reduced-motion setting: transitions collapse to an instant state change rather than being merely shortened.

06

Typography

The brand sheet specifies Lucida Bright, Calibri Light and Segoe UI Emoji. None of the three can be licensed or embedded in an iOS or Android application; they are Microsoft desktop faces. Substitutes were chosen to serve the product's actual job rather than to imitate the originals.

Role	Brand sheet	Ships as	Reason
UI, data, all body	Calibri Light	Inter	Designed for screens; true tabular figures
Brand moment	Lucida Bright	Lora	Serif warmth for the wordmark and splash
Emoji	Segoe UI Emoji	System emoji	Platform native on iOS and Android

Lora is confined to the login wordmark, the splash screen and section titles in printed collateral such as this document. It never appears in the application's working screens — a serif at 13pt inside a dense revenue table costs legibility and buys nothing.

label	13 / 16	Medium	+0.6	Field labels, uppercase eyebrows
caption	12 / 16	Regular	+0.2	Timestamps, helper text
overline	11 / 14	SemiBold	+1.0	Chip text, table headers

07

Numerals & currency

Eight of the twenty-five screens in the PRD exist to show numbers: the reservation dashboard, the reports hub, segment productivity, revenue and ARR, the revenue module, guest revenue splits, corporate rankings and the owner dashboard. Numerals are therefore a first-class concern, not a typographic footnote.

> **Tabular figures are mandatory**
> Every currency value, room number, percentage, count and date uses fontFeatures: [FontFeature.tabularFigures()]. Without it, Inter's proportional figures give the digit 1 a narrower advance than 8, and a column of rupee values will not align down its decimal. On a budget-versus-actual report this reads as a rendering bug.

Rupee formatting

Values follow the Indian numbering system — grouping in lakh and crore, not thousands — because every reader of this app reads them that way. Abbreviate only where space forces it, and never inside a table the user may compare down.

Context	Format	Example
Table cell, full precision	₹##,##,###	₹ 2,84,000
Large value, full precision	₹#,##,##,###	₹ 1,24,50,000
Stat tile, constrained width	₹#.##L / ₹#.##Cr	₹ 2.84L · ₹ 1.25Cr
Chart axis tick	₹#L / ₹#Cr	₹ 3L ₹ 6L ₹ 9L
Variance against budget	+/− with sign always	−₹ 42,000 +₹ 1,18,000
Occupancy, percentages	##% no decimal below 100	82%
ARR, RevPAR	₹#,### with no paise	₹ 4,850
Room nights, counts	plain integer, tabular	1,284

Alignment

- Numeric columns align right. Text columns align left. There is no third option.
- A currency symbol sits with the label or the column header where every value shares it, so the digits themselves stay flush. Repeat ₹ on every row only in a mixed-currency table, which v1 does not have.
- Negative variance is shown with a minus sign and the danger colour, never with parentheses — accountants read parentheses, shift supervisors do not.
- A value that is genuinely zero shows 0. A value not yet entered shows an em dash. Given that v1 revenue data is keyed in by hand, this distinction is load-bearing.

08

Space, shape & elevation

Spacing scale

A 4pt base. Anything not on this scale is a mistake, with one exception: hairlines and focus offsets may use 2pt.

Token	Value	Applied to
space.xs	4	Icon to label, chip inner padding
space.sm	8	Between related controls, chip gaps
space.md	12	Card inner padding on phone, list row vertical
space.lg	16	Screen side gutter, card padding, section gap
space.xl	24	Between distinct sections
space.2xl	32	Above a screen's first section
space.3xl	48	Empty-state vertical breathing room

Radius & elevation

Token	Value	Applied to
radius.sm	6	Inputs, small tiles
radius.md	8	Cards, sheets, dialogs
radius.lg	10	Buttons
radius.full	999	Chips, avatars, badges, FAB
elevation.0	border only	Cards — a 1pt neutral.200 outline, no shadow
elevation.1	y2 blur6 8%	Bottom navigation, sticky table header
elevation.2	y6 blur16 12%	Bottom sheets, menus
elevation.3	y12 blur28 16%	Dialogs, the FAB

Cards are outlined, not floated

A room status board can hold forty cards at once. Forty shadows turn into visual noise and cost scroll performance on the mid-range Android devices most staff carry. Elevation is reserved for surfaces that genuinely sit above the page: sheets, dialogs, menus, the FAB.

Layout

- 16pt side gutter on phone, 24pt on tablet. Nothing touches the screen edge except a deliberately full-bleed image or a table that scrolls horizontally in its own container.

- Content maximum width 720pt on tablet, so report tables do not stretch into unreadable line lengths on an iPad Pro.
- Wide tables scroll horizontally inside their own container with the first column pinned — the room number, guest name or corporate name must stay visible.
- The page body itself never scrolls sideways.

09

Iconography & status language

One vocabulary, used identically wherever a state appears. A room that is Vacant Clean on the housekeeping board is Vacant Clean on the reservation dashboard, in the same colour, with the same word. Inconsistency here is the fastest way to lose trust in the data.

ROOM STATE

- Vacant clean
- Vacant dirty
- Occupied
- Inspected
- Out of order
- Out of service

PAYMENT STATE

- Paid
- Part paid
- Pending
- Overdue
- Refunded

TASK STATE

- Unassigned
- Assigned
- In progress
- Blocked
- Done

Icons

- Outline style, 2pt stroke, 24pt grid, rounded caps. Filled variants indicate the active navigation item only.
- Sizes: 16 inline with text, 20 in list rows, 24 in navigation and app bars, 32 in empty states.
- An icon never appears alone where it carries meaning a user must act on. Every icon-only control has an accessible label, and destructive icon-only controls do not exist.
- Status icons pair one-to-one with the vocabulary above and are never reassigned: a circle-check is Done and nothing else.

10

Components

Scoped to what the PRD's screens actually require. Each entry states its purpose and, where it matters more, when to reach for something else instead.

Buttons

New booking | Assign | View report | Cancel booking

Primary is Fox Deep filled; one per screen region. Secondary is outlined. Text buttons carry navigation. Destructive is danger-filled and always confirms in a dialog naming what will be lost. Height 44 on phone, 48 where the target is a primary frontline action.

StatTile

ARRIVALS	IN-HOUSE	PENDING PAYMENT
12	64	₹ 2,84,000
		8 folios

Label above, value below, optional qualifier beneath. The value is the largest thing in the tile. A tile turns Fox Deep only when the figure requires action — pending payment, rooms out of order, tasks overdue. Three tiles per row on phone maximum; beyond that the numbers shrink below reading size.

DataTable

ROOM	GUEST	NIGHTS	AMOUNT	STATUS
204	Sharma, R.	3	₹ 8,400	Paid
118	Iyer, M.	1	₹ 6,200	Pending
302	Khan, A.	5	₹ 24,750	Part paid
221	Deshpande, V.	2	₹ 11,900	Overdue

Sticky header, first column pinned, numeric columns right-aligned and tabular. Row height 44 so the whole row is a comfortable target. Status arrives as a chip, never as a coloured row background — a tinted row fights the selection state and defeats the zebra.

Remaining set

Component	Purpose	Note
StatusChip	Room, payment, task state	Label always present; colour is reinforcement
RoleBadge	Who a person is	Neutral tint plus text — never a per-role hue
ListRow	Booking, guest, corporate, task	Leading avatar or room number, trailing state
TaskCard	Assignable unit of work	Owner, due time and status are all mandatory
SegmentedControl	Today / MTD / YTD	Maximum four segments before it becomes a select
DateRangePicker	Custom report ranges	Presets first; the calendar is the fallback
PropertySwitcher	Chain hotel and city switch	Owner and area roles only; persists per session
SearchField	Guest, corporate, room lookup	Debounced; shows recent before results
BottomNav	Up to five destinations	Labels always visible — icon-only fails at speed
AppBar	Title, context, one action	Fox Deep in light, surface.raised in dark
BottomSheet	Assign, filter, quick edit	Drag handle; dismiss never loses typed input
Dialog	Confirm destructive or irreversible	Names the consequence in the body, not the title
Toast	Confirmation of a completed action	4 seconds; carries Undo where the action allows
EmptyState	Nothing here, and that is fine	States the fact, offers the next action
ErrorState	Something failed	Says what failed and how to retry
OfflineBanner	Weak or absent signal	Persistent; names how many updates are queued
Skeleton	Loading dense screens	Matches final layout; never a centred spinner

Empty states carry the mascot; nothing else does

The FoxOtale fox is the one place the Staff App is allowed to be warm: an empty task queue, a completed shift, a first-run onboarding step. It never appears on the reservation dashboard, a report or a room board. A mascot beside a revenue variance reads as a product that is not taking the number seriously.

11

Roles & permission states

Seven roles on a strict ladder. The visual system deliberately does not give each role a colour: seven hues would exhaust the palette, collide with the four semantic states, and encode a hierarchy that colour cannot express anyway. A role is shown as text in a neutral badge.

Owner · Area GM · Area HM · GM / HM · Ops Manager · Supervisor · Executive

How permission shows up

Situation	Treatment
Role cannot see a module	The navigation entry does not exist
Role can view but not edit	No edit affordance rendered; content reads normally
Role can act only on own work	List is pre-filtered; no 'all items' toggle appears
Role must approve, not perform	Approve and Return actions replace the edit action
Action blocked by state, not role	Control visible and disabled, with the reason beside it

Role hiding and state disabling are different things
Hide what the role may never do — that is a permission boundary and PRD P0-1 requires it. Disable what this particular person could normally do but cannot right now, and always say why: 'Cannot check out — folio has ₹6,200 pending.' A disabled control with no explanation is the worst of both.

Density by role

An Owner scanning a chain and an Executive clearing a queue are not served by the same information density. The system supports two densities from the same tokens: comfortable, with 48pt rows and 16pt gutters, for frontline roles working quickly on a phone; and compact, with 40pt rows and 12pt gutters, for management roles reading tables. Density is a property of the screen, set by its primary role — not a user preference toggle in v1.

12

Data visualisation

The reports layer is the reason owners will open this app, and it is the layer most easily ruined by colour chosen for looks. The palettes below were generated against the brand and then machine-validated for lightness banding, chroma, contrast against the chart surface, and separation under deuteranopia, protanopia and tritanopia. They pass. Colours added later must be validated the same way.

CATEGORICAL — LIGHT MODE

Assigned in fixed order and never cycled. Series one is brand-aligned so the primary measure carries FoxOtale's colour. A ninth category folds into Other.

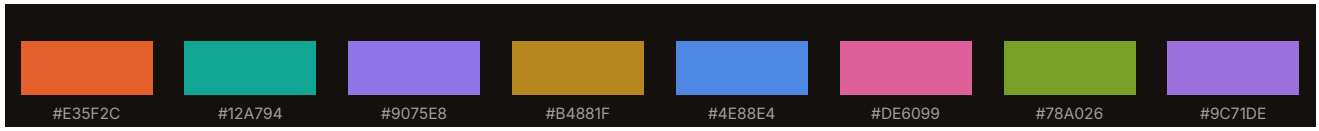

chart.categorical.light — validated: CVD ΔE 11.3 worst adjacent pair

Corporate · OTA · Direct · Travel agent · Walk-in · Banquet · Long stay · Other

CATEGORICAL — DARK MODE

Selected against the dark chart surface, not lightened automatically from the light steps. Validated independently.

SEQUENTIAL — MAGNITUDE

One hue, light to dark. Used for the occupancy heat map and the demand calendar. Never a rainbow.

chart.sequential — occupancy 0% → 100%

DIVERGING — POLARITY

Two hues around a neutral midpoint, for budget-versus-actual variance. The midpoint is grey, never a third hue.

chart.diverging — under budget ← on plan → over budget

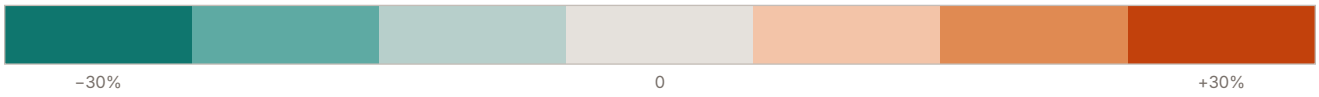

Chart rules

- One vertical scale per chart. Never two y-axes — revenue and occupancy on shared axes produce a relationship that is not in the data. Use two charts or index both to a base.
- Colour follows the entity, not its rank. Filtering the segment list must not repaint the segments that remain.
- Two or more series always carry a legend; four or fewer are also labelled directly on the marks, so identity never depends on colour alone.
- Semantic colours never appear as a series. Success green in a chart means good, not 'the fourth category'.
- Grid lines and axes are recessive — neutral.200 hairlines. The data is the only thing with weight.
- Every chart has a table view behind it. For a v1 product where all this data is keyed in by hand, the operator will need to check the figures against what they entered.
- Chart text takes text tokens, never the series colour.

Choosing the form

The question	The form
What is today's position?	Stat tiles — not a chart
How does this month compare to last?	Grouped bars, two series
Where does business come from?	Horizontal bars, ranked — not a pie
How has ARR moved across the year?	Line, single series, endpoint labelled
Which dates are in demand?	Calendar heat map, sequential ramp
Are we on plan?	Bullet or diverging bar against the budget marker
Who are the top corporates?	Ranked table with an inline bar in the cell

> **No pie charts**
> Segment and market-source productivity is the most-requested report in the PRD, and it is the classic pie-chart temptation. A ranked horizontal bar answers 'who is biggest' faster, holds eight segments without collapsing, and can carry the room nights and revenue figures directly on the mark.

13

Motion

Motion in this product exists to explain a change of state, never to entertain. A supervisor clearing thirty rooms should not wait on thirty animations.

Token	Duration	Curve	Applied to
motion.instant	0ms	—	Status chip change, checkbox
motion.fast	120ms	ease-out	Press feedback, chip selection
motion.base	200ms	ease-in-out	Sheet, dropdown, expansion
motion.slow	280ms	ease-in-out	Page transition, hero figure change

- Nothing animates for longer than 280ms. Above that the interface feels slow rather than smooth on a busy shift.
- A number that changes counts up only on the owner dashboard, and only on first load — never on refresh, where the movement obscures whether the value actually changed.
- Reduced-motion collapses every transition to an instant state change, not to a shorter one.
- Skeletons pulse; they do not shimmer across the screen.

14

Do & don't

DO	DON'T
Use Fox Deep for the app bar and any orange text.	Set white text on Fox Flame or Fox Ember — both fail AA.
Give every status a word beside its colour.	Ship a room board where green and red are the only difference.
Right-align every numeric column and use tabular figures.	Let a rupee column drift because Inter's default figures are proportional.
Hide modules a role may never open.	Render an Owner dashboard greyed out for a Supervisor.
Keep the mascot to empty states, onboarding and login.	Place the fox beside a revenue variance or an escalation.
Outline cards; save shadow for sheets, dialogs and the FAB.	Float forty room cards on a status board.
Rank segments with horizontal bars.	Draw a pie chart of market source.
Say what failed and how to retry.	Show 'Something went wrong' with a reload icon.
Show an em dash where v1 data has not been keyed in yet.	Show ₹0 for a figure nobody has entered.

15

Token reference

Naming for lib/theme/. Tokens are referenced through the theme extension, never as raw hex in a widget. A colour literal in a widget file is a review failure.

FILE LAYOUT

File	Holds
lib/theme/fox_colors.dart	Every colour token, light and dark
lib/theme/fox_typography.dart	Text styles, tabular figure helper
lib/theme/fox_spacing.dart	Space, radius, elevation, touch target
lib/theme/fox_theme.dart	ThemeData assembly, ThemeExtension registration
lib/theme/fox_charts.dart	Validated chart palettes and scale helpers

ACCESS PATTERN

```
final fox = Theme.of(context).extension<FoxTheme>()!;

Text('₹ 2,84,000', style: fox.type.figureLg)   // tabular by construction
Container(color: fox.color.surfaceRaised)
SizedBox(height: fox.space.lg)
```

NAMING RULES

- Colour tokens name their role, not their appearance: surfaceRaised, textSecondary, brandAction. A token called orange700 cannot survive a rebrand or a theme.
- Semantic tokens are never aliased to brand tokens. semantic.danger is not brand.flame, even on a day when they look similar.
- Chart palettes are exported as ordered lists, and series index is assigned from the entity's stable identity — never from its position after sorting.
- Every token exists in both themes. A token defined only for light mode is the defect that produces white text on a white ground.

16

Open items

What this version does not settle, and what it is waiting on. Each of these blocks a specific part of the build.

Item	Blocks	Waiting on
§7 permission matrix contradicts its own role ladder	Access layer, every screen	Business decision
Definition of an 'area' for chains	PropertySwitcher, area dashbo…	Business decision
Who enters budget figures, and how often	Budget vs actual reports	Business decision
Demand calendar data source	Demand calendar, revenue mo…	Business decision
One role per person, or multiple	RoleBadge, navigation model	Business decision
Offline support for frontline updates	OfflineBanner, sync states	Engineering scope
Where GST invoicing lives	Check-out flow	Finance and Guest App …
Mascot artwork set and export sizes	Empty states, onboarding	Design production
Icon library: adopt or draw	All components	Design production

Changelog

Version	Date	Change
v1	2026-09-13	First issue. Foundations, components, chart palettes, tokens.
